

Project Motivation

Project Motivation

- This project was created with the aim of addressing challenges commonly associated with traditional paper-based systems. The project seeks to tackle current gaps in these systems, which may include inefficiencies, delays, and difficulties in managing information. Additionally, ensuring the security of data is a key goal of the project. This involves protecting information from loss or damage and proposing the adoption of measures to preserve data integrity and provide it permanently. It also requires ensuring user privacy, which includes managing access control permissions and ensuring that users have appropriate and secure access to data while safeguarding sensitive information. In addition to the significant advancements in the field of artificial intelligence, this project aims to integrate these capabilities to enhance healthcare efficiency. This is achieved by accelerating data analysis and improving the precision of decision-making.
