

Project Goal

Project Goal

- The main purpose of this project is to design a web application that supports the properties of decentralized technology (Blockchain) and smart contracts using JavaScript and the React library. The project consists of a control panel and a user interface, aiming to manage patient records and store data in a decentralized manner, contributing to providing more privacy for the user. Additionally, the project seeks to reduce costs for healthcare centers and improve decision-making accuracy through the use of artificial intelligence techniques.
